Abstract

It is predicted that there will be over 1.8 million unfilled cybersecurity jobs in the world by 2022. Help is needed to make the current security professionals more efficient and augment their intelligence. This assistance is coming from artificial intelligence (AI). This seminar would introduce the applications of AI in different aspects of cybersecurity.

Biography

James is a IT professional with over 25 years working experience at the IT security field. He has extensive experience in training, post-sales technical support, presales technical support, project management and people management in Asia Pacific.
